QPSK Modulator/Demodulator Example

This documents describes/implements the QPSK modulation and demodulation of a song signal.

Prepared for ELEC 301

by Alper T. Erdogan

16.03.2020

Program Initialization

```
%Clear Variables and Close All Figure Windows

% Clear all previous variables
clear
% Close all previous figure windows
close all
```

Read and Display an Example Image

cameraman.tif is an example gray-level image provided my matlab

Load the Cameraman Image

```
Im = imread('cameraman.tif');
% Extract part of the image
Im=Im(51:100,101:150);
```

Display the image

```
imshow(Im);
```

Convert Image to a Binary Vector

We need to convert the image to a binary bit sequence

Convert 256x256 image matrix to an image (column) vector (of size 256²x1) by concatenating columns

```
Imv=Im(:);
```

Convert each the number in each row to a binary vector

```
Imvb=de2bi(Imv);
```

Note that **Imvb** has size 256²x8

Now generate a row vector containing all bits

```
Imvbt=Imvb';  
s=Imvbt(:)';
```

Generate Modulated Signal

QPSK Modulated Signal

From the single bit sequence generate a vector sequence

```
sv=[s(1:2:end);  
     s(2:2:end)];
```

D-QPSK Constellation Mapper [0;0]-> exp(i*pi/2) [0;1]-> 1 [1;0]-> -1 [1;1]-> exp(-i*pi/2)

```
for k=1:size(sv,2)  
    switch num2str(sv(:,k))  
        case '0 0'  
            c(k)=exp(i*pi/2);  
        case '1 0'  
            c(k)=1;  
        case '0 1'  
            c(k)=-1;  
        otherwise  
            c(k)=exp(-i*pi/2);  
    end  
end
```

```

% Normalize the power to 1
c=c/sqrt(2);

Rectangle Modulation

% Sample Rate
Fsampling=2^19;
% Sample Intervale
Tsampling=1/Fsampling;
% Symbol Rate
Fsymbol=2^13;
% Symbol Period
Tsymbol=1/Fsymbol;
% Number of Samples per Symbol Period
Ns=Tsymbol/Tsampling;

Baseband Signal (samples)

xb=kron(c,ones(1,Ns));

Carrier frequency:

 $f_c = 60kHz$ 

fc=60e3; % 60 kHz;

Carrier signal: _

 $c(t) = \cos(2\pi f_c t)$ 

t=(0:1:(length(xb)-1))*Tsampling;
cost=cos(2*pi*fc*t);
sint=sin(2*pi*fc*t);

Transmitter output

 $x(t) = \text{Re}(xb(t))\cos(2\pi f_c t) - \text{Im}(xb(t))\sin(2\pi f_c t)$ 

x=real(xb).*cost-imag(xb).*sint;

```

Display the Segments of Baseband Signal and Modulated Signal

Display small section of the original signal and then the DSB-SC modulated version

```

figure(2)
% Segment Length
SL = 800;
% plot the segment of imaginary component (for SL samples)
subplot(2,1,1);
plot(t(1:SL)*1000, imag(xb(1:SL)));
xlabel('Time (msecs)');
title('Imaginary Part of Baseband Segment');

```

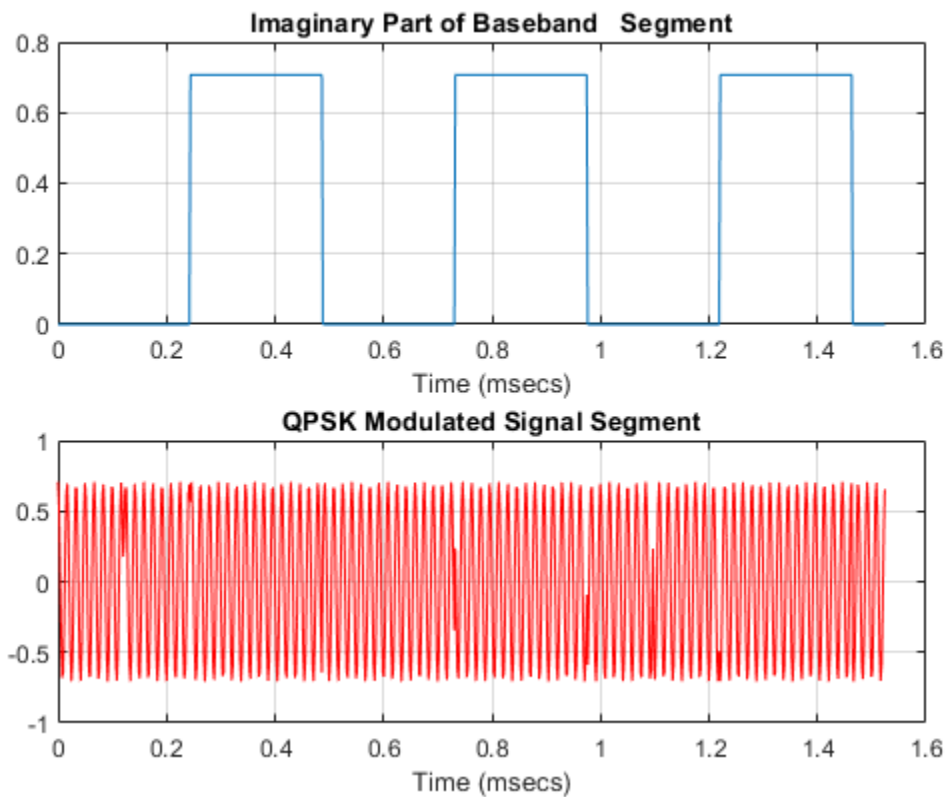

```

grid;

subplot(2,1,2);
% plot the modulated signal
plot(t(1:SL)*1000,x(1:SL),'r');
hold on

xlabel('Time (msecs)');
grid;
title('QPSK Modulated Signal Segment');

```

Channel Effect

We add some noise

First calculate average signal energy (per sample)

```
sigpow=mean(x.^2);
```

Define SNR level in (dB)

```
SNR=10;
```

Noise Level

```
NoiseAmp=sqrt(10^(-SNR/10)*sigpow);
```

Generate Noise signal as Gaussian Noise

```
noise=NoiseAmp*randn(1,length(x));
```

Noisy received signal

$$y(t) = x(t) + n(t)$$

```
y=x+noise;
```

The QPSK Receiver Processing

Coherent QPSK Receiver operation

First extract real component baseband signal

$$u_r(t) = 2x(t)\cos(2\pi f_c t)$$

```
BER = zeros(21);
```

```
for i = 1:21
```

```
ur = 2*y.*cos(2*pi*fc*t + (i-1)*pi/10);
```

Then low pass filter this signal

$$z_r(t) = u_r(t) * h_{LP}(t)$$

```
zr = lowpass(ur,30e3,Fsampling);
```

Then extract the imaginary component baseband signal

$$u_i(t) = 2x(t)\sin(2\pi f_c t)$$

```
ui = 2*y.*sin(2*pi*fc*t + (i-1)*pi/10);
```

Then low pass filter this signal

$$z_i(t) = u_i(t) * h_{LP}(t)$$

```
zi = lowpass(ui,30e3,Fsampling);
```

Basband signal

```
z=zr+i*zi;
```

Fourier Transforms of Baseband, Modulated and Demodulated Signals

Calculate and Display the Fourier Transforms of the Baseband,modulated and demodulated signals

Calculate the Fourier Transform of the baseband signal

```
[ftxb,freqs]=fouriertransform(xb, Fsampling);
```

Calculate the Fourier Transform of the passband signal

```
[ftx,freqs]=fouriertransform(x,Fsampling);
```

Calculate Fourier Transform of the receiver baseband

```
[ftz,freqs]=fouriertransform(z,Fsampling);
```

Constellation Estimates

We sample the baseband received signal to get noisy estimates of transmitted constellation point. This is not the best way though. Any other suggestions for improvement?

```
ce=z(ceil(Ns/2):Ns:length(z));
```

```
figure(5);  
% Plot constellation estimates  
plot(real(ce),imag(ce),'.');  
hold on  
p=plot(real(c),imag(c),'r.');
```

set(p,'MarkerSize',5);
xlabel('Real Part');
ylabel('Imaginary Part');
grid;

Bit Estimates

We implement D-QPSK Demapper to extract bits from constellation estimates

Check which quadrant ce lies in

```
ser=real(ce)>0;
sei=imag(ce)>0;

for k=1:size(sv,2)
    switch num2str(sv(:,k))
        case '0 0'
            se(1:2:(2*length(ser)))=exp(i*3*pi/4)*ce>0;
        case '1 0'
            se(2:2:(2*length(ser)))=exp(i*pi/4)*ce>0;
        case '0 1'
            se(2:2:(2*length(ser)))=exp(-i*3*pi/4)*ce>0;
        otherwise
            se(1:2:(2*length(ser)))=exp(-i*pi/4)*ce>0;
    end
end
```

Calculate Bit Error Rate

```
BER(i)=sum(se~=s)/length(s);
```

Reconstruct Image

From the bits we estimated, we reconstruct 8-bit gray level image

```
Imvbe=reshape(se,8,length(s)/8)';
% Vectorized image estimate in decimals
Imve=bi2de(Imvbe);
% Image estimate in matrix form
Ime=reshape(Imve,50,50);
figure(6)
subplot(1,2,1)
imshow(Im)
title('Transmitted')
subplot(1,2,2)

imshow(uint8(Ime))
title(['Received: BER=' num2str(BER(i))]);
```

end

Display these Fourier Transforms

```
figure(3)
subplot(3,1,1);
plot(freqs/1000, 20*log10(abs(ftxb)));
axis([-Fsampling/2000 Fsampling/2000 -40 100])
legend('Message', 'Location', 'Best')
xlabel('Frequency (kHz)');
title('Fourier Transform of Message Signal')
subplot(3,1,2)
plot(freqs/1000, 20*log10(abs(ftx)), 'r');
grid
legend('Modulated', 'Location', 'Best')
xlabel('Frequency (kHz)');
title('Fourier Transform of Modulated Signal')
axis([-Fsampling/2000 Fsampling/2000 -40 100])
subplot(3,1,3)
plot(freqs/1000, 20*log10(abs(ftz)));
axis([-Fsampling/2000 Fsampling/2000 -40 100])
grid
xlabel('Frequency (kHz)')
title('FT of Receiver Demodulator Output')
```

Display the Original Song and the Receiver Output Segments

Can you feel the noise?

Comparing the imaginary components of transmitted and received baseband signal segments

```
figure(4)
plot(t(1:SL)*1000,imag(xb(1:SL)),'r')
hold on
plot(t(1:SL)*1000,imag(z(1:SL)))
grid
xlabel('Time (msec)');
ylabel('Waveform');
legend('Original','Received','Location','Best');
```

BER Rate for High SNR

```
figure(9);  
plot(0:pi/10:2*pi, BER);  
grid;  
xlabel('Phase Error (rad)');  
ylabel('Bit Error Rate');  
title("Phase Error's Effect on Bit Error Rate with High SNR");
```

LOW SNR CASE

Define new SNR level in (dB)

```
SNR=1;
```

```
% Noise Level
NoiseAmp=sqrt(10^(-SNR/10)*sigpow);
% Generate Noise signal as Gaussian Noise
noise=NoiseAmp*randn(1,length(x));
% Noisy received signal
y=x+noise;
% The QPSK Receiver Processing
% First extract real component baseband signal
% $u_r(t)=2x(t)\cos(2\pi f_c t)$
for i = 1:21

ur = 2*y.*cos(2*pi*fc*t + (i-1)*pi/10);

% Then low pass filter this signal
zr = lowpass(ur,30e3,Fsampling);
% Then extract the imaginary component baseband signal
ui = 2*y.*sin(2*pi*fc*t + (i-1)*pi/10);
% Then low pass filter this signal
zi = lowpass(ui,30e3,Fsampling);
% Basband signal
```

```
z=zr+i*zi;
```

Constellation Estimates

```
ce=z(ceil(Ns/2):Ns:length(z));
```

Bit Estimates

Check which quadrant ce lies in

```
ser=real(ce)>0;
```

```
sei=imag(ce)>0;
```

```
for k=1:size(sv,2)
    switch num2str(sv(:,k))
        case '0 0'
            se(1:2:(2*length(ser)))=exp(i*3*pi/4)*ce;
        case '1 0'
            se(2:2:(2*length(ser)))=exp(i*pi/4)*ce;
        case '0 1'
            se(2:2:(2*length(ser)))=exp(-i*3*pi/4)*ce;
        otherwise
            se(1:2:(2*length(ser)))=exp(-i*pi/4)*ce;
    end
end
```

Calculate Bit Error Rate

```
BER(i)=sum(se~=s)/length(s);
```

Reconstruct Image From the bits we estimated, we reconstruct 8-bit gray level image

```
Imvbe=reshape(se,8,length(s)/8)';
% Vectorized image estimate in decimals
Imve=bi2de(Imvbe);
% Image estimate in matrix form
Ime=reshape(Imve,50,50);
figure(6)
subplot(1,2,1)
imshow(Im)
title('Transmitted')
subplot(1,2,2)

imshow(uint8(Ime))
title(['Received: BER=' num2str(BER(i))])
```
